

Protect Your Server Rooms . . . Safeguard Your Business!

The reliance on IT resources has never been greater. Communications, email and data storage are all heavily dependent on the continued functioning of IT systems and equipment. Server rooms are at the centre of our information systems . . . **yet many are not adequately protected.**

- **They should be protected by a gas suppression extinguishing system** that will activate at the first hint of smoke or fire protecting equipment and software from damage.
- **They should be protected by fire resistant and smoke sealed enclosures** – statistics show that the majority of incidents of fire disruption to Comms Rooms are caused by a fire starting elsewhere in the building and spreading inwards.
- **They should be checked and certified annually** to ensure that the integrity of the enclosure and validity of insurance cover has not been breached by the introduction of new cables which would prevent the extinguishing system from functioning correctly.

Checkmate Fire are a specialist fire protection company operating throughout the UK and Arabian Gulf, with many years experience in providing practical cost effective solutions to both save lives and protect businesses.
